

DAY-1 ASSIGNMENT

Javascript runtime refers **to where your javascript code is executed when you run it.**

runtime.js is an open-source library operating system (unikernel) for the cloud that runs JavaScript, can be bundled up with an application and deployed as a lightweight and immutable VM image.

It's built on [V8 JavaScript engine](#) and uses event-driven and non-blocking I/O model inspired by Node.js. At the moment [KVM](#) is the only supported hypervisor.

It tries to be compatible with npm module ecosystem and supports some of the Node.js API.
